Data Structures and Algorithms – ICT2113 **Level 2- Semester 1**

Laboratory Assignment

Objectives:

Understand the implementation of Binary Tree data structure in C.

1) Consider the following C program that constructs a Binary Search Tree (BST) and performs an inorder traversal.

   The program should prompt the user to input the number of nodes to be inserted and then request the values of these nodes.

   Once the BST is constructed, it should perform an inorder traversal and print the nodes in sorted order.

```
// [Include necessary headers]

struct node
{
   int data;
   struct node *left;
   struct node *right;
};

void inorder(struct node *root);

int main()
{
   // [Code for input and building BST]

   printf("\nBinary Search Tree nodes in Inorder Traversal: ");
   inorder(root);
   printf("\n");

   return 0;
}
```
